

Marketing and branding

Influencers = people paid on social media to promote a product

Product placement = product put into a film or series or programme

Catch phrases = e.g. Nike 'just do it'

Branding = using colours/logos/styles

Celebrity endorsement = paying a celebrity to use/promote their product

64

GCSE Design & Technology Revision Booklet

You **CAN** do this, good luck!
from Mrs Dhami

1

Design ideas/iterations

Design strategies

= methods of creating design ideas

- Sketching
- CAD
- Prototyping
- Primary user designing
- Collaborative designing
- Focus group studies
- AI

Communication methods:

- Sketches
- Exploded diagrams (good for self assembly)
- CAD prototypes
- Physical prototypes
- AI
- VR/AR

62

Material properties

Hardness (soft)

Ability to resist
scratches and
indentation

Styrofoam is very soft
as can scratch easily.

Impact resistance/ impact strength (brittle)

Ability to withstand
sudden impact.

Ceramics are very brittle.
Polymers such as rubber
are very impact resistant.

Durability (not durable)

Ability to withstand
wear and tear over
time.

Metal pegs that do not
rust are more durable
than polymer ones that
become brittle.

3

Form vs Function

Form = aesthetics: the way something looks

Function = the way something works

Is form or function more important?

Fashion clothes = **form** is often valued more.

Waterproofs/hiking clothes = **function** is often valued more.

You decide depending which product it is!

2

Design optimisation

= product design and development requires that engineers consider trade-offs between product attributes in the areas of cost, weight, manufacturability, quality and performance.

It is about determining how to arrive at the best overall design, making the right compromises and not sacrificing critical attributes like safety.

Global sustainable development

= meeting the needs of our generation without compromising the needs of future generations

63

Material properties

Strength to weight ratio

Strength of an object in comparison to its weight.

Composites such as CFRP or GRP has excellent strength in comparison to their weight.

Strength

Ability to withstand forces that try to bend or break it.

e.g. compressive strength = withstand squashing forces.
Tensile strength = withstand stretching forces

Thermal conductivity (thermal insulator)

Ability to allow heat to pass through.

Cool bags are thermal insulators.

4

Scales of production

One off: 1-2

Wedding dresses/cakes/tailored suits.
Very expensive and require lots of skill!

Batch production: 10-100

Seasonal products e.g. Christmas decorations

Mass production: 1000's

Lots of identical objects e.g. nuts and bolts. High initial cost but cheap in long run.

61

Structural integrity

= ways to provide strength without using too much extra material.

Triangulation = used to reinforce structures/bridges/buildings

Boning (rigid parts inside clothing)
Darts (a sewn fold in fabric)
Layering (extra material e.g. collar/cuff)

Ribs and webbings inside boxes/cases
Ribs/lips on polymer single use cups.

60

Material properties

Elasticity (plasticity)

Ability to be stretched and return to original shape.

Leggings, stretch to fit around legs.

Plasticity (elasticity)

Ability to change shape when a force is applied.

HIPS in vacuum former.

Corrosion resistant (not durable)

Ability to withstand damage from air/water or chemicals.

These are not corrosion resistant: Rust on ferrous
Timbers rot
Polymers go brittle

5

Circuit symbols

58

Material properties

Absorbency

Ability to soak up moisture.

Towels are made of cotton to soak up water.

Flammability (fire resistant)

Ability of a material to burn or ignite.

Nomex is used because it has good fire resistance.

Electrical conductivity (electrical insulator)

Ability to allow electricity to pass through.

Copper for electrical wire.

7

Material properties

Density

The mass per unit volume.

Balsa wood feels like Styrofoam – it has lower density than oak.

Ductility

Ability to be stretched out into **wires** without breaking (DUCK beak, remember?!)

Electrical wiring uses copper that can be drawn out into long wires.

Malleability

Ability to be shaped into **large sheets** without cracking or bending (MALL, remember?!)

Aluminium rolled into sheets ready for cans.

6

Production aids = help to increase the efficiency/repeatability/accuracy of manufacture

formers

moulds

templates

jigs

patterns

stops

59

Timber source = trees

Softwoods = trees that do not lose leaves
Pine/ cedar (natural oils, water resistant)

Hardwoods = trees that do lose leaves
Oak/ Balsa (lightweight)/ spruce (paper)/ teak (natural oils, water resistant)

Manufactured boards = made by humans
MDF (sawdust)/ Plywood (layers)/ chipboard (chips)

8

Electronics: flow diagram and components

input

Change in light/sound/movement
e.g. microphone/switch

process

Brain of the system
e.g. microcontroller
such as microbit

output

Such as light/sound/movement
e.g. buzzer/motor/speaker/LED

57

Pulley systems transmit rotary motion from a driver **pulley** wheel (starts the motion) to a driven **pulley** wheel through a belt.

The belt fits into a groove on the **pulley** wheels and motion is transferred through **friction**.

Crossing the belt makes the driver and driven **pulley** wheels turn in opposite directions.

56

Metal source = ore

Ferrous = contain iron

Steel/ iron

Non ferrous = do not contain iron

Copper (conductor)/ aluminium (lightweight)/ brass (corrosion resistant)

Alloys = a mixture of 2 or more metals

Brass/ stainless steel/solder

9

Levers

Class 3 lever

Effort is positioned anywhere between the **fulcrum** and the **load**.

Examples

tweezers

tongs

Third class levers are useful for tasks requiring control, accuracy and precision.

54

Polymers

Thermoplastomers = can be heated and reshaped
HDPE (bottle tops)/ LDPE (bags)/ PVC (pipes)

Thermosetting polymers = cannot be reheated and reshaped

Silicone (flexible cup cake moulds)/ urea-formaldehyde (plug sockets and light switches)

Biopolymers = biodegradable polymers

PLA (3D printers and bags)/ potatopak/ biopol

11

Textiles

Synthetic = from crude oil
Polyester/ rip stop nylon

Natural fibres = from animals/plants
Cotton/wool/silk

Blended fibres = mix of different fibres

Technical textiles = made for performance not appearance
Kevlar/Nomex

10

Cams

= a mechanical component that converts rotary motion into linear motion

pear

eccentric

snail

Cams are often used in toys to create movement.

55

Thermopolymers

HDPE	synthetic from fossil fuels, lightweight, resistant to chemicals, high impact resistance, foodsafe	bottle tops, milk bottles
-------------	---	---------------------------

LDPE	synthetic from fossil fuels, lightweight, flexible, foodsafe	bin bags
-------------	---	----------

PVC	synthetic weather resistant	uPVC doors PVC (plasticised) drain pipes
------------	------------------------------------	--

12

Levers

Class 2 lever

Load is positioned anywhere between the **fulcrum** and the **effort**.

Examples

wheelbarrow

nutcracker

Second class levers are common in tools and machines designed to reduce the **effort** needed for heavy lifting or squeezing.

53

Levers

Class 1 lever

Fulcrum is positioned anywhere between the **load** and the **effort**.

Examples

see saw

opening tins

scissors

First class levers can provide a **mechanical advantage (MA)** by amplifying force.

52

Thermosetting polymers

silicone

foodsafes, grippy,
soft, flexible

cup cake trays for
oven, sealants,
handle bar grips

melamine formaldehyde

heat and corrosion
resistant

laminated kitchen
worktops, light
switches

epoxy resin

chemical resistant,
brittle

adhesive
Used in CFRP, GRP

13

Types of motion

rotary

oscillating

linear

Reciprocating
(Up and down or
side to side)

50

Smart materials

= respond to environment by changing properties.

thermochromic

Changes colour due to heat

Baby spoons and
photo mugs

photochromic

Changes colour due to light

Glasses that
change to
sunglasses in UV

Shape memory alloys (SMA)

When heated remembers and
goes back to original shape

SMA mattresses/pillows
and glasses frames

15

Biopolymers

PLA	Low melting point. Made from corn starch/sugars, biodegradable.	 3D printing, coffee cup lids
------------	--	--

biopol	Made from vegetable starch, degrades naturally	Disposable drink cups and cutlery
---------------	--	-----------------------------------

potatopak	Made from potato starch, compostable	Food packaging
------------------	--------------------------------------	----------------

Shellac	Naturally occurring polymer secreted by lac bug. DOES NOT easily degrade.	 Nail varnish/timber varnishes
----------------	---	---

14

Levers

Making the handle longer, increases the **arm length** from the **fulcrum**, which increases the **mechanical advantage (MA)**. This makes it easier to cut through the metal without increasing **effort**.

51

Smart materials

= respond to environment by changing properties.

hydrochromic	Changes colour due to water/moisture	Water colour in books/umbrellas with hydrochromic patterns
---------------------	--------------------------------------	--

polymorph	Melts when heated and can be moulded by hand into any shape.	Orthopaedic aids
------------------	--	------------------

Bioconcrete Self healing material	Uses bacteria that react with water to 'heal' itself by producing limestone to fill any micro cracks.	Concrete
--	---	----------

16

New and emerging technologies

New and emerging technologies have provided opportunities for **design decisions** to be more **inclusive**:

Assistive technologies for example, screen readers, reading pens, speech to text software and voice assists.

Augmented reality (AR) fitting rooms let you try on clothes or glasses virtually, making shopping more accessible for everyone.

49

Drones: New and emerging technologies

Drones are flying devices that can be controlled remotely or can fly on their own using software and sensors. Drones are not just used for hobbies:

aid delivery

assessing flood damage

rescue drones

48

Modern materials

= continually being developed through the invention of new or improved processes

kevlar

Lightweight and extremely tough

Bullet proof vests

nomex

Fire resistant

Fire fighters/astronaut clothing

fastskin

mimics the skin of a shark giving a streamlining effect underwater and reducing drag (resistance).

Competitive swim clothing

17

AI: New and emerging technologies

AI is a type of technology that allows machines to think, learn, and make decisions like humans, such as:

- Chatbots, for example customer service bots that can answers questions.
- Image recognition, for example facial recognition in photos.
- Virtual assistants that can answer simple questions or perform tasks such as turning on music.
- Text to image AI that can produce or render design ideas.

New and emerging technologies can be used to improve safety without harming people in the process.

46

Composites

= two or more materials not chemically joined.

CFRP

Carbon fibre reinforced polymer

Strong and lightweight, expensive, difficult to recycle

Helmets, sports equipment e.g. bikes

GRP

Glass reinforced polymer

Strength in many directions, expensive, difficult to recycle

Boats/canoes

Laminates

(if different materials)

Cheap in comparison to solid soft/hardwood tops due to cheap inner core

Table tops: desks, kitchen worktops

19

Modern materials

= continually being developed through the invention of new or improved processes

PLA 	Low melting point, made from cornstarch	3D printer, disposable cups and compostable bags
microencapsulation 	Ability to release tiny bubbles of liquid or substances with wear.	antiseptic medical fabrics, sportswear, allergy control
teflon 	Water resistant/easy to remove stains/stops food sticking to pans	Coating on non stick pans, school uniform

18

Biometrics: New and emerging technologies

= uses unique body features for identification.

voice recognition

finger prints

iris or retina scan

facial recognition

47

Injection Moulding

e.g.
Lego bricks
Pen lids

① Polymer pushed along heated Archimedes screw

② Polymer injected into mould

③ Mould filled

④ Mould released, product produced

⑤ Degating

20

Ergonomics

= how we use anthropometric data to make a product more comfortable to use.

45

Anthropometrics

The **5th percentile** tell us the smallest 5% of measurements e.g. petite range.

The **95th percentile** tells us the largest 5% of measurements in the data set e.g. tall clothing range.

44

Fairtrade = ensures everyone is paid fairly and ensure good working conditions:

- **Fairtrade price** = ensures a minimum price
- **Fairtrade premium** = goes into the community e.g. water pumps/education/storage facilities

Living income = the amount of money needed for a household to have a decent standard of living.

42

Extrusion

e.g.
Products with the **same cross section**
Curtain rails
Pipes

① Polymer pushed along heated Archimedes screw

② Polymer injected through die and cooled

③ Long parts with same crosssection produced

21

Rotational Moulding

e.g.
Hollow objects
Refuse/recycling bins
Garden toys

① Mould filled with polymer powder

② Mould heated and rotated

③ Mould cooled and rotated

④ Mould released, product produced hollow

23

Blow moulding

e.g.
Hollow products (tend to be **smaller** than rotational moulded products
Bottles

① Polymer pushed along heated Archimedes screw

② Polymer extruded in as parison

③ Air pumped

④ Mould released, product produced hollow

Vacuum Forming

e.g.
yoghurt pots

① Former is placed in the bottom of the vacuum former

② Polymer sheet is placed on top of former and heat is applied from the top of the vacuum former

③ Platform with former is moved up into the warm polymer sheet

④ Air sucked out Platform with former moved down (can then be reused)

⑤ product produced hollow

24

Anthropometrics

= measurements of the human body.

anthropometrics

means
'human'

means
'measure'

hand span

height

head
circumference

grip strength

43

Life cycle assessment: design decisions

41

Life cycle assessment

Life cycle assessment (LCA) is where the environmental impact is assessed at **every single stage** of the product's life cycle so that, through **design decisions**, the environmental impacts can be **reduced**.

How do you carry out **LCA**?

You can assess the following at each stage:

- source of energy
- amount of energy required
- amount of **carbon emissions**

40

Compression moulding

e.g.
Thermoset products
Light switch
Plug sockets

25

The linear economy

Products are **used once** and then **often thrown away**.

single use coffee cup

disposable nappy

non-rechargeable battery

fast fashion

38

Polymers: source to stock forms

Oil drilling; to extract crude oil from the ground.

Fractional distillation; heat separates crude oil into fractions which are then **cracked** to produce **monomers** such as propene.

Polymerisation process; monomers are joined together to make polymer chains such as polypropylene.

Polymers are made into stock forms such as sheets/pellets/powder.

Stock forms undergo manufacturing processes.

27

Polymer sources

A **source** is where a material originally comes from.

Polymers have two main **source** categories:

- **naturally occurring** (comes from nature; not made or altered by humans)
- **synthetic** (manufactured through chemical processes):

26

The circular economy

The **circular economy** can be defined as an economic system where products and materials are kept in circulation and **do not become waste**.

bags for life

encouraging clothes recycling

re-rechargeable ports

reusable nappies

39

Polymer stock forms

Rod (solid cylindrical): for example, dowels and handles.

Tube (hollow cylindrical): for example, piping and straws.

Sheet: for example, vacuum forming, packaging and signage.

Foam: for example, insulation, prototyping and packaging inserts.

Granules (small pellets): used in moulding processes, for example, injection moulding.

Filament (strands of polymer): for example, 3D printing.

Powder (fine particles): used in coating or forming, for example, powder coating or rotational moulding.

Film: for example, packaging or decoration.

28

Polymer finishing processes

A fine, **abrasive polish** can be used to remove any scratches and give a shiny finish.

Buffer machine is a rotating polishing tool used to quickly smooth and shine the surface of polymers.

Texture/embossing/patterns/text can be included in the **surface of a mould** so that extra finishing is not required.

37

Polymer finishing processes

A **sublimation printer** and heat press can transfer vibrant, permanent **aesthetics** onto specially coated polymers (**surface preparation**).

Pad printing is an industrial finishing method used to transfer images to larger products that may not have a flat surface such as refuse bins.

Vinyl cutters or CNC plotters cut vinyl stickers.

36

Sustainability and environmental impacts of polymers:

The refining **process** results in carbon emissions and air and water pollution. There is also the potential for oil spills and fires.

Transporting crude oil or polymers from far locations contributes to carbon emissions.

Single use polymers contribute to landfill and ocean pollution if not recycled.

Polymers can harm animals and their habitats.

Polymers break down into small parts creating microplastic pollution.

Some polymers can be difficult to separate for recycling e.g. laminates. Polymers must be sorted.

29

Polymer finishing processes: additives

Stabilisers - protection against UV damage so that polymers do not turn brittle when outside. For example, uPVC window frames.

Pigments - add colour, reducing the need for painting. For example, children's toys.

Plasticisers - influence the **function** by creating flexibility. Rigid PVC pipe vs flexible PVC hosepipe.

34

Polymer joining

Snap fit: easy to open

Snap fit: difficult to open

Rivets

Push fit

Screws

Nuts/bolts/washers

31

Standard components

= parts that have already been made.

e.g. screws, nuts, bolts, washers, rivets, zips, buttons, hinges, electrical components, gears

30

Polymer finishing processes

Laser engraving patterns/logos/symbols.

Hydro-dipping = a printed film floats on water and transfers its **aesthetic** pattern onto a polymer surface when the object is dipped.

Over-moulding = one polymer is moulded over another to create a single part with multiple materials or textures such as a toothbrush.

35

Polymer joining

Epoxy resin (two – part)

Hot glue/super glue

Polymer welding

Solvent welding: tensol cement

32

Polymer finishing processes

Gate = excess from point of 'injection' = **degating**

Flashing = excess between two-part mould = **deflashing**

33
